

IBOMENO BASIEKANEM

Data Analyst | Forecasting, Power BI, SQL, Tableau
Manchester, UK | ibomenobasiekanem@gmail.com | 07508 126273
Portfolio: thelordbass.github.io | [LinkedIn](#) | [GitHub](#)

PROFESSIONAL SUMMARY

Data Analyst in a small MI function supporting a large multi-channel contact centre at British Airways, responsible for monthly agent requirement forecasting, capacity planning, and shrinkage and occupancy modelling. Builds production Power BI and Tableau reporting on star-schema models using Power Query and DAX, and automates recurring reporting in SQL and Excel. Rigorous about measurement: defines metrics so they cannot silently disagree, reports missing and unattributed data rather than hiding it, and tests assumptions before reporting them.

CORE SKILLS

Forecasting & Planning: Demand Forecasting, Capacity Planning, Agent Requirement Modelling, Shrinkage & Occupancy Analysis, Scenario & Cost Modelling

Power BI: Power Query / M, DAX (CALCULATE, VAR, DIVIDE, ISBLANK, CALENDAR), Star Schema Modelling, Drill-Through, KPI Design

SQL: PostgreSQL, SQL Server, MySQL, Multi-Table Joins, CTEs, Window Functions, Aggregations, CASE Logic

Tableau & Excel: Dashboard Design, Parameters, Reference Lines; Power Query, XLOOKUP, INDEX/MATCH, Nested IFS, Pivot Tables, VBA

Python & Analysis: Pandas, NumPy, ETL, Reporting Automation; Data Quality Validation, EDA, Correlation, Segmentation, Trend & Seasonality Analysis

PROFESSIONAL EXPERIENCE

Customer Service Analyst — British Airways, Manchester, UK

April 2023 – Present

- Produce the monthly agent requirement forecast underpinning capacity planning for a large multi-channel contact centre, translating contact volume history into headcount numbers the operation plans against.
- Model shrinkage and occupancy to convert raw requirement into deliverable staffing, and set out the assumptions behind each forecast so planning decisions account for how wrong the number could reasonably be.
- Build and maintain the Tableau and Power BI dashboards used by agents and team leaders to track performance against SLA across telephony, email, and webchat.
- Automated recurring manual reporting using SQL and Excel, reducing preparation time and freeing MI capacity for analysis rather than data assembly.
- Work with operational stakeholders to turn open-ended requests into defined reporting requirements, and present findings in clear, non-technical terms.

SELECTED PROJECTS

Airline Departure Punctuality — Northline Air *(Power BI, Power Query / M, DAX)*

- Modelled 45,886 flight legs over 18 months as a star schema with a marked date table and IATA delay-code dimension; found on-time performance at 78.2% against an 80% target, with a repeating February trough near 71% that reframes winter disruption as a predictable planning problem.
- Established reactionary delay as the costliest category per event (29.8 minutes average despite the fewest occurrences), identifying turnaround buffer as the highest-leverage intervention, and reported 11.2% of delay events as unattributed rather than omitting the gap.
- Corrected a DAX defect where BLANK() coerced to zero silently counted unrecorded flights as on time, and rebuilt punctuality and delay rate on a shared denominator so the two measures cannot drift apart.

Airline Customer Complaints — Northline Air *(Power BI, DAX)*

- Tested the assumption that complaints track punctuality across 977 complaints and £172K of compensation, and disproved it: correlation of 0.11, with three quarters of complaints originating from flights that departed on time.
- Showed compensation exposure is volume-driven rather than category-driven (average payout flat at £172–£197 across all six categories), and identified a uniform 22.4-day resolution time as a capacity constraint rather than case complexity.

Mobile Game Revenue — Tactic Royale *(Power BI, Power Query / M, DAX)*

- Analysed 16,296 transactions across 14,151 players, establishing that 12x revenue growth came from acquisition volume rather than deepening spend — a more fragile position — and that the top 10% of payers generate 64.5% of revenue.
- Rebuilt currency conversion after finding the supplied GBP column null on 26% of rows (understating revenue by a quarter), removed 209 duplicate billing records inflating revenue by 1.2%, and forced en-GB date parsing to prevent silent day/month transposition on 10,691 rows.

Driver Incentive Scheme Modelling *(SQL)*

- Costed two competing bonus structures for a forecast demand spike and recommended the \$1,050 flat-rate scheme over the \$2,696 per-trip alternative, which largely rewarded trips that would have happened anyway.
- Identified a larger opportunity neither scheme addresses: 10.9% of drivers are well-rated but under-engaged, the biggest pool of latent supply on the platform.

EDUCATION

BSc (Hons) Information Technology & Business Information Systems · Middlesex University · First Class Honours 2021
